Variables

Variables are the names which we use to store the values. When we do $5+8$ it just executed not stored in the memory but when you use the variable $a = 5+8$ it executes & get stored in the memory so we can call  use in the future.

Rule to declare Variables

Valid Variable declaration

$a = 2$

$A = 4$

$num = 20$

~~num~~ $num1 = 8$

$num2 = 90$

$num8 = 12$

$std = 123$

$stu-id = 127$

$-stu-name = "Prade"$

$a, b, c = 4, 6, 1$

$x = 8; y = 2; z = 8;$

Invalid Variable Declaration

Inum = 5

stu name = "Paradeep"

@num = 8

Collect a Persons data

Name = str

age = int

phone num = str

emailId = str

address = str

instaId = str

Height = float

Weight = float

Education = str

Work exp = float

Salary = float

CompanyName = str

DOB = Dat. / str

MaritalStatus = str

gender = str

Bloodgroup = str

input/output function

Print() - output function

input() - input function

Note: when we are taking input from user we should declare variables.

Note: we can check what ~~type~~ ^{which} datatype used

Print(name, type(name))

Print(age, type(age))

o/p: Paradeep <class 'str'>
22 <class 'int'>

when taking
i/p from user
for storing in
variable
