

1st topic in Python:

1) Comments :
it is a part of code but it dont take any place in execution.

types of Comments

→ Single line Comment : #

My 1st Program

→ Multiline Comment : ''' '''

''' Write a Program to calculate
Student result '''

''' Write a Program to Calculate
Student result '''

2nd topic in Python :

2) Keywords :

They are reserved words that have special meaning & cannot be used as identifier.

identifier :- Variable name @ Function name etc

Keyword example : int, float, true, false, bool, try, for, else ... etc

3) Third topic :

3) Data types :

it mention what type as data it was

str
int
float
bool
Complex

Sequence datatypes (data structure)

str
list
tuple
set
dict

1) Numeric Types

- int $\rightarrow$ whole numbers (e.g. 10, -5)
- float $\rightarrow$ decimal numbers (e.g. 3.14, -0.5)
- Complex $\rightarrow$ numbers with real + imaginary part (e.g. $2+2j$)

2) Text Type

- str $\rightarrow$ sequence of characters (e.g. "Hello", 'Python')

3) Boolean Type

- bool $\rightarrow$ True $\odot$ False. Used for conditions and logic

4) Sequence Types

- list $\rightarrow$ Ordered, changeable collection (e.g. [1, 2, 3])
- tuple $\rightarrow$ Ordered, unchangeable collection (e.g. (1, 2, 3))
- range $\rightarrow$ Sequence of numbers, often used in loops (e.g. ~~range(5)~~
(e.g. range(5)))

5) Set Types

- set $\rightarrow$ Unordered collection with unique values
(e.g. {1, 2, 3})

6) Mapping Type

- dict $\rightarrow$ key-value pairs (e.g. {"name": "Pradeep", "age": 22})
